

Ride Hailing Creation & Service-Gating Fix

Finalized decisions and immediate actions

Project	TrackTour - Tourism promotion & food delivery, Bansud, Oriental Mindoro
Subsystem	Transportation / Ride Hailing dispatch and acceptance
Date	23 September 2026
Scope	Backend only. Two defects in <code>TransportationService::createRide()</code> plus one dependent consumer.
Outcome	Targeted and full regression suites pass with zero failures.

1. Checkpoint Statement (finalized)

Ride Hailing creation and service-gating defects fixed. Ride creation now persists required order-item fields correctly, rides use **order_type = transport**, and transport acceptance / re-offering follows the correct service type. Targeted and full regression suites pass with zero failures. Ride business ownership remains a separate deferred issue.

2. Defects Found

Defect 1 - Ride creation never persisted

The ride order item was created with `description` and `price`, but neither is in `OrderItem::$fillable`, so mass assignment silently dropped both. The required `product_name` and `unit_price` columns (both NOT NULL) were never supplied.

```
SQLSTATE[HY000]: General error: 1364
Field 'product_name' doesn't have a default value
```

Every ride booking failed with a 500. Because `createRide()` ran unguarded with no transaction, the parent `orders` row committed before the item insert threw, leaving an orphaned order.

Defect 2 - Wrong service type

The ride was stored as `order_type = delivery` instead of `order_type = transport`.

Both the accept gate and the re-offer path derive the gated service from that column:

```
$serviceType = $order_type === 'transport' ? 'transport' : 'food';
return $rider_detail->current_service === $serviceType;
```

Consequences:

- A ride-hailing rider accepting a non-COD ride resolved to **ineligible**.
- Rejected / expired rides were re-offered to **food** riders.
- `TransportController::index` and `HistoryController` filter on `order_type = 'transport'`, so rides never appeared in transport history and instead showed under food.
- The COD branch of the gate skips the service check entirely, so cash rides behaved differently from GCash / Maya / Card rides. The column fix makes both branches agree.

3. Finalized Decisions

D1 - Rides persist with order_type = transport

This is the canonical discriminator. It is the value every existing consumer already expected; writing 'delivery' was the defect, not the readers.

D2 - Order items use the real column names

product_name and unit_price. The previous keys were not fillable and were dropped without error.

D3 - Order + item + delivery commit atomically

Wrapped in a single DB::transaction so a partial failure can no longer leave an orphaned orders row.

dispatchToNearest(\$delivery, 'transport') stays outside the transaction and is unchanged.

D4 - Auto-cancel coverage widened, not narrowed

AutoCancelUndeliveredOrder now uses whereIn('order_type', ['delivery', 'transport']). Rides only inherited this protection because they were mislabeled; the fix must not silently drop it.

D5 - No schema change and no data migration

SHOW CREATE TABLE orders confirms order_type varchar(255) NOT NULL DEFAULT 'pickup'. The text "delivery, pickup, dine_in" is a column comment, not an enum or CHECK constraint, so 'transport' stores without DDL. The development database holds 0 TRP-% rides, confirmed before and after a rolled-back live probe, so there is no legacy data to backfill.

D6 - Service gating was not weakened

Verified unchanged: the dispatchToNearest() candidate filter, the accept-time service gate, the COD acceptance branch, SmartDispatchService::scheduledDispatch() (its order_type !== 'delivery' early-return now correctly skips rides, which already dispatch directly and would otherwise have been re-dispatched to food riders after payment), the PaymentController post-payment dispatch hook, OrderRefundService (rides carry delivery_fee = 0), and the kitchen / preparation gates.

D7 - Ride business ownership stays deferred

createRide() hardcodes business_id = 1 and creates items without a business_id. This is **not** part of the service-gating fix and must not be mixed into this change unless the intended ride-ownership model is decided first.

4. Verification

Run	Tests	Assertions	Failures	Notes
Targeted RideHailingAcceptanceTest	5 passed	25	0	Real dispatch wave + real atomic accept transaction
Full Laravel suite	359 total 352 passed / 7 skipped	1,711	0	244.77s

? vs the previous working-tree checkpoint (354 tests / 1,686 assertions / 0 failures / 7 skipped) = **+5 tests / +25 assertions** = exactly RideHailingAcceptanceTest. **Zero regressions.**

The 7 skips are the same known environment skips: 4 GD-guarded OCR tests, OfferingManagementTest GD, TouristApiTest SQLite HAVING, and RepositoryTest Haversine.

Coverage delivered by the new tests

- Ride persists as transport with a valid item + delivery and reaches notified.

- **A transport rider is offered AND accepts a GCash ride** (the reported defect).
- A food rider is offered nothing, and a forged offer is refused at the accept gate.
- A transport rider is still refused a food delivery (gating not weakened).
- The ride lists under the transport history tab and never the food tab.

5. Immediate Actions

1. **Record the checkpoint** using the statement in Section 1. `docs/PROGRESS.md` already carries the full entry with root causes, fixes, test list, regression numbers and database verification.
2. **Adopt the new baseline:** 359 tests / 1,711 assertions / 0 failures / 7 skipped for the next change.
3. **Keep business ownership out of this commit.** Do not include any `business_id` change. Open a separate decision for the ride-ownership model first, then implement it on its own.
4. **Manual device QA:** set Service Types to Ride Hailing, book a ride, confirm the ping arrives, accept it, and confirm a Food Delivery rider receives no ride ping. Repeat with Service Types set to Food Delivery.
5. **Commit the four touched artifacts as one checkpoint:** `app/Services/TransportationService.php` , `app/Console/Commands/AutoCancelUndeliveredOrder.php` , `tests/Feature/RideHailingAcceptanceTest.php` , `docs/PROGRESS.md` .
6. **Reconcile stale checkpoint numbers in AGENTS.md**, which still documents 305 tests / 1,479 assertions against an actual pre-change working-tree baseline of 354 / 1,686.

Do not regress: COD settlement, credit-free COD eligibility, the rider acceptance gate, `SmartDispatchService` , payment idempotency, the refund processor, rider payout architecture, GPS token security and the existing Socket.IO infrastructure were all left untouched by this change.

6. Files Changed

File	Change
<code>app/Services/TransportationService.php</code>	<code>order_type => 'transport'</code> ; item fields corrected to <code>product_name</code> / <code>unit_price</code> ; order + item + delivery wrapped in one transaction.
<code>app/Console/Commands/AutoCancelUndeliveredOrder.php</code>	Query widened to <code>whereIn('order_type', ['delivery', 'transport'])</code> to preserve ride auto-cancel coverage.
<code>tests/Feature/RideHailingAcceptanceTest.php</code>	New - 5 tests / 25 assertions covering creation, dispatch, acceptance, gating in both directions, and history tabbing.
<code>docs/PROGRESS.md</code>	Checkpoint entry: root causes, decisions, test evidence, database verification, deferred item.

Generated 23 September 2026 for the TrackTour engineering record. Regression evidence: 359 tests, 1,711 assertions, 0 failures, 7 skipped.
